

Have a discussion with your group mates comparing your design document to your finished project. Create a separate document that describes the changes explaining why they were made.

The Login page in our design plan consisted of four separate fields for users who were logging in, and users who were going to register. In our implementation, we decided to only have two fields, and two buttons. This allowed for a more simplistic design, and since people were more likely to login than register, it made sense to not create a completely separate field for it.

We changed our home page to give the users a better experience. Instead of having the stories that the user didn't contribute to in a sidebar of the home page, we made a separate page to display those stories. We also added more functions than anticipated in SQL.py to make it easier to access information from our data base.

Another feature that we wanted to implement was writing the updates to a story in a text file. Unfortunately we were unable to get this to work, so we had to store it in the database.
